Abstract.

1. Introduction

Durante o processo de desenvolvimento de jogos em que existe algum tipo de combate com Non-Playable Characters (NPC), os desenvolvedores buscam criar combates que entretenham, divirtam e mantenham o jogadores engajados, sem tornar os repetitivos. Como uma alternativa aos os métodos heurísticos tradicionais, a utilização de machine-learning se mostra uma alternativa promissora para Dynamic Difficulty Adjustment (DDA) dos combates em jogos.

Para tanto, foram analisados diversos artigos [Mortazavi1 et al. 2024] nos quais são abordados diversas técnicas de implementação da mecânicas de combate utilizado machine-learning como, Belgian Artificial Intelligence (BAI) [Mi and Gao 2022], AI agent using deep reinforcement learning with self-play [Kim et al. 2020], Dynamic Difficulty Adjustment (DDA) [Moon et al. 2022], Reinforcement Learning (RL) [Pagalyte et al. 2020] entre outras em diversos gêneros de jogos.

2. Method

3. Conclusion

[Fuchs et al. 2024] and [Kim et al. 2020]
[Mi and Gao 2022] and [Moon et al. 2022]
[Pagalyte et al. 2020] and [Zeng and Sweetser 2022]
